

Advansia/PNØ – Project New Østfold Hospital

From Peter Mendis – Quality and Safety Advisor Advansia - PNØ

After presenting the program to the management at Advansia and the project director for the new østfold hospital «Prosjekt nytt østfoldsykehus» we implemented our tailor-made Zylin Incident Manager (ZIM) to register and track all HSE nonconformities over the construction period of 4 years. The program was invaluable in tracking the status of each of the over 3000 incidents recorded. The data provided us with the foundation for our weekly safety inspections, providing us with the necessary know-how as to how each contractor worked with and handled the non-conformities he was responsible for. The program was very helpful also in the “lessons learned” concept where the photographs registered in the program were very helpful. There is no doubt that ZIM was instrumental in our record low H value of 1.77. The project was in 2013 the largest on-going land based project in Norway. This is most probably, at least a national, if not world record for an H-value for such a large construction project.
